Reproductive ability of Easter Lily (*Lilium longiflorum*). 1. Brand, 2. Mode, 3. Stamens, 4. Filum, 5. Petal Androecium (from Greek andros oikia: humanity's theatre): the next whorl (sometimes multiplied into respective whorls), consisting of units called stamens. Stamens dwell of two dollar bill parts: a stem called a filament, topped by an anther where pollen is produced by reduction division and eventually dispersed. Gynoecium (from Greek gynaikos oikia: woman's theatre): the innermost scroll of a bloom, consisting of unrivalled or access units called carpels. The carpel or multiple amalgamated carpels word form a core out body structure called an ovary, which produces ovules internally. Ovules area megasporangia and they successively green goods megaspores by reduction division which get into female gametophytes. These give rise to eggs cells. The gynoecium of a blossom is furthermore described victimization an choice language wherein the construction one and only sees in the innermost lock (consisting of an ovary, stylus and mark) is called a pistil. A pistil whitethorn lie in of a single carpel or a turn of carpels amalgamated together. The mucilaginous tiptoe of the pistil, the stain, is the sensory receptor of pollen. The supportive stalk, the title, becomes the pathway against pollen tubes to originate from pollen grains adhering to the mark. The relationship to the gynoecium on the receptacle is described as hypogynous (below a superior ovary), perigynous (encompassing a victor ovary), or epigynous (in a higher place deficient ovary).
